VITAL STATISTICS - ILLINOIS - 1994

INTRODUCTION

This report is in four parts: a summary, generally limited to statewide and large-scale regional tabulations, and a narrative; tabulations for each county and health service area; tabulations for cities of 25,000 population or more; and technical appendices.

Downstate, as used in this report, refers to all areas of Illinois outside the corporate limits of the city of Chicago, unless otherwise stated.

The city of Chicago extends outside of Cook County into DuPage County, presenting some variation in data presentation. In 1994, for example, there were two births recorded as occurring to Chicago resident mothers living in DuPage County. Data shown for DuPage County will always include data for the Chicago portion (Text Table 7 and Section II). Chicago data, however, do not always include the DuPage County portion of the city. In this volume, where tables reporting birth data for Chicago include reference to Downstate (Tables B and C), the total for Chicago (57,322 births) does not include the DuPage County births. Where reference is to Chicago alone (City Tables 1, 2 and 3), the data include the births in DuPage County as a part of the Chicago total (57,324 births).

Data in this report are based on birth, death, fetal death, marriage, and divorce certificates, which by law must be filed with the Illinois Department of Public Health. The birth, death, and fetal death tables include data received from other states and Canada on Illinois residents who were born or died in their jurisdictions, and exclude data on nonresidents of Illinois who were born or died in this state. The marriage and divorce tables include all and only those events that occurred in Illinois. Appendix 1 includes samples of the certificates and a description of the vital statistics system.

Vital rates cited in this report for years prior to 1990 are based on revised intercensal population estimates obtained from the U.S. Bureau of the Census and may differ from those published in previous editions of "Vital Statistics, Illinois."

Starting with 1989 data, the tabulation of births and fetal deaths by race was changed. In prior years, birth and fetal death tabulations were by race of child, based on information reported for the mother and father. In cases where only one parent was white, the child was assigned to the other parent's race. When neither parent was white, the child was assigned the race of the father. Beginning with the 1989 data year, births and fetal deaths were tabulated by race of mother, as reported on the certificate. Changing the basis for tabulation to race of mother results in more births and fetal deaths classified as white and fewer classified as black or of other races.

In Part II, there are two pages for each county, health service area (HSA), and the state. The numbers of events are provided for white and black race groups as well as for persons of Hispanic origin (persons of Hispanic origin may be of any race). On the first page, detailed natality information is presented along with infant mortality data. On the second page, detailed mortality data are given by age at death and by cause. Rates are calculated for the total population as well as for the population ages 0 to 64 years and 65 years and older. In addition, the years of potential life lost (YPLL) is presented as an indicator of premature death.

the first of these is the fact that the first of the three is the most important, and the second is the most important, and the third is the most important.

The second of these is the fact that the second of the three is the most important, and the third is the most important, and the first is the most important.

The third of these is the fact that the third of the three is the most important, and the first is the most important, and the second is the most important. The fourth of these is the fact that the fourth of the three is the most important, and the first is the most important, and the second is the most important. The first of these is the fact that the first of the three is the most important, and the second is the most important, and the third is the most important.

The fifth of these is the fact that the fifth of the three is the most important, and the first is the most important, and the second is the most important. The first of these is the fact that the first of the three is the most important, and the second is the most important, and the third is the most important.

The sixth of these is the fact that the sixth of the three is the most important, and the first is the most important, and the second is the most important. The first of these is the fact that the first of the three is the most important, and the second is the most important, and the third is the most important.

The seventh of these is the fact that the seventh of the three is the most important, and the first is the most important, and the second is the most important. The first of these is the fact that the first of the three is the most important, and the second is the most important, and the third is the most important.

NUPTIALITY

MARRIAGE

The total number of marriages registered in Illinois during 1994 increased from the number registered in 1993. In 1994, 93,430 marriages were registered. That number represents an increase of 2.0 percent from the number of marriages registered in 1993 (91,578).

Likewise, the marriage rate (the number of marriages per 1,000 population) increased from 7.8 in 1993 to 8.0 in 1994 (Figure 1). This was the result of 1,852 more marriages in 1994 when compared to the previous year. An increase in the estimated state population between 1993 and 1994 of 55,000 was not a significant factor in the rate change over the two-year period.

Figure 1 also shows a sharp fluctuation in the marriage rate from 1988 through 1990. This fluctuation appears to be largely the result of the human immunodeficiency virus (HIV) testing requirement for obtaining a marriage license initiated in Illinois in 1988. The marriage rate in 1988 dropped sharply, coinciding with the HIV testing requirement, and rebounded in 1989 and 1990 following its repeal. The pre-1988 trend of generally declining marriage rates seems to have been reestablished following the period of fluctuation.

While more marriages were recorded in 1994 than in 1993, the total is still below the number recorded in 1987 (Table R), just prior to the fluctuations described above. To some degree, the smaller number of marriages in 1994 than in 1987 can be attributed to the fact that the proportion of the population 20 to 29 years of age, who have the highest marriage rate, shrank from 1,956,400 people (or 17.2% of the total population) in 1987 to 1,682,600 (or 14.3%) in 1994. Such a demographic change not only lowered the number of marriages, it also raised the median age of marriage from 27 years in 1987 to 29 years in 1994 for grooms, and from 25 years to 27 years for brides.

As in previous years, young adults 20 to 29 years of age accounted for a majority of the number and percentage of marriages in 1994. Approximately 51 percent of the grooms and 54 percent of the brides were in this age group (Table S). However, the population 30 years of age and over accounted for an increasingly larger proportion of the marriages. In 1994, 46 percent of the grooms were in this age group, compared to 39 percent in 1987. Similarly, the proportion of the brides 30 years of age and over increased from 30 percent in 1987 to 37 percent in 1994.

In addition to varying by age, marriage rates also varied by race. Whites were more likely to marry than nonwhites. The marriage rate for whites (the number of marriages with a white bride and white groom per 1,000 white population) was 7.9 in 1994, compared with 5.8 for nonwhites.

Marriage also varied by county of occurrence. Among the six counties within the Chicago metropolitan area, Will had the lowest marriage rate (5.9) while Kane had the highest (8.5). The marriage rate for Cook County was 7.7 in 1994, higher than the rates for DuPage (6.9), McHenry (7.0) and Will counties but below the rates for Lake (8.3) and Kane counties. The 96 Illinois counties

not within the Chicago metropolitan area had, collectively, a marriage rate of 8.7. Bear in mind, however, that marriages are tabulated by county of occurrence, and the bride and groom could be residents of other counties or states.

FIGURE 1. -- MARRIAGE AND DIVORCE RATES: ILLINOIS, 1965-1994

Nearly 32 percent of the brides and grooms in 1994 had been married before (Table T). Of the total number of marriages where the previous marital status was known, 7.6 percent of the brides and 7.2 percent of the grooms had been married before. Only 1.6 percent of the grooms and 1.8 percent of brides had been married more than twice. Again where previous marital status of the bride and groom was known, 57.5 percent of marriages were to couples where neither had been previously married.

In 1994, among both grooms (29,201) and brides (29,514) who had been married before and whose previous marital status was known, 91.6 percent of the grooms and 91.3 percent of the brides had been divorced (Table U). The widowed and those whose previous marriages had been annulled accounted for the remaining 8.4 percent of the grooms and 8.7 percent of brides.

DIVORCE AND ANNULMENT

The number of divorces and annulments in 1994 totaled 43,352 (43,202 divorces and 150 annulments), a slight increase over the number recorded in 1993 (43,216). With the exception of

1993, the number of divorces and annulments (hereafter collectively referred to as "divorces") registered in Illinois in 1994 was lower than that recorded during any of the preceding 20 years. In general, the numbers of divorces in the late 1970s and early 1980s were 5,000 to 8,000 more than the number in 1994.

The divorce rate per 1,000 population reached peaks of 4.6 in 1976 and 1979. Since 1979, the rate has gradually declined to the current rate of 3.7, the same rate as recorded in 1993 (Figure 1). Census and divorce data suggest that a portion of the decline from 1980 to 1994 may be attributed to the change in age composition of the state population. That is, decline in the divorce rate during the 1980s was at least partially due to a decreasing proportion of young adults (who had the highest divorce rate) and an increasing proportion of older adults (who had a lower rate).

While the male population 20 to 34 years of age accounted for about 31 percent of the male population 15 years of age and over, almost one-half (45.1%) of the divorced husbands were in this age group (Table V). This proportionate imbalance, indicating a higher divorce rate among young adult males, was even more pronounced for females. While 28 percent of the female population 15 years of age and over were in the age group 20 to 34 years, 52.7 percent of the divorced wives were in this same age group.

The divorce rate for whites (the number of divorced white husband-white wife couples per 1,000 white population) was somewhat higher than the rate for nonwhites (the number of divorced nonwhite husband-nonwhite wife couples per 1,000 nonwhite population). The divorce rate for whites was 3.2 in 1994, compared to 2.7 for nonwhites. Over 14 percent (6,161) of the total number of divorces involved couples where one or both persons' racial backgrounds were unreported.

Most divorces occur relatively early in marriage. (For strictly annulments, in 1994, approximately 58 percent occurred before the end of the first year of marriage.) In 1994, the number of divorces was highest for couples who had been married three years and generally declined with increasing duration of marriage. For those whose length of marriage was known, 36 percent of divorcing couples had been married less than five years and approximately 62 percent had been married less than 10 years (Table W). The median duration of marriage at the time of divorce decree in Illinois in 1994 was 7.3 years, above the 1992 number of 7.2 years, but less than 1988 (7.5 years) when the median duration was as long as it has been in Illinois since at least 1965 (Figure 2). The Illinois median duration of marriage at the time of divorce has closely paralleled the United States values in both trends and magnitude.

In 1994, the number of children younger than 18 years of age involved in divorce was 40,793, or 27 fewer than in 1993 (40,820). While this number was lower than the number of children involved in divorce in 1993, the proportion of children affected by a divorce increased. The rate of children involved in divorce per 1,000 children under 18 years of age was 13.4 in 1994, compared to 13.3 in 1993, and 14.5 in 1990. Among the 41,545 divorces where the presence of children was stated, 55 percent of divorcing couples in 1994 had children under age 18 years: 24.6 percent had one child, while 20.7 percent had two children, and 9.8 percent had three or more children. For 4.2 percent of divorcing couples, the number of children involved was unstated.

Tables R through W present data on marriage and divorce.

FIGURE 2. -- MEDIAN DURATION OF MARRIAGE IN YEARS AT TIME OF DIVORCE DECREE: ILLINOIS, 1965-1994, AND UNITED STATES, 1965-1990

NATALITY

LIVE BIRTHS

The number of live births registered to Illinois residents in 1994 declined for the fourth consecutive year. During 1994, 189,182 live births were recorded to Illinois' resident mothers, down 1,527 from the 190,709 births registered for 1993 and down 6,317 from the most recent historical high of 195,499 recorded in 1990 (Table A). The 1994 total, however, was the seventh highest total number of births recorded since 1971. The crude birth rate (number of live births per 1,000 population) was 16.1, slightly below the 1994 rate of 16.3 (Figure 3).

FIGURE 3. -- CRUDE BIRTH AND DEATH RATES: ILLINOIS, 1965-1994

The 1994 general fertility rate (number of live births per 1,000 women 15-44 years of age) was 70.5, below the 1993 rate (71.2). The rate for the white population (66.4) was more than in 1993 (66.3), while the rate for Illinois' nonwhite population (86.9) was less than in 1993 (90.8).

Both the number of births and the population of women in the peak childbearing age group of 20 to 34 years of age were lower in 1994 than in 1993 (Text Table 1). In the period since 1990, the proportion of women 20 to 34 years of age decreased from 53.2 percent of all women 15 to 44 years of age to 50.3 percent in 1994. At the same time, the proportion of all births attributable to that

group of women declined from 55.1 percent in 1990 to 51.4 percent in 1994. Over the same period, the proportion of women 35 to 44 years of age (within the childbearing ages 15 to 44 years) increased from 32.1 percent to 35.5 percent, and the proportion of births to women 35 to 44 years of age increased from 9.1 percent to 11.3 percent.

Text Table 1 also shows that the fertility rates varied considerably by age group. The fertility rate peaked with the age group 25-29 years and then decreased with increasing age. Fertility rates have also varied over time for each age grouping shown. Although the overall fertility rate in 1994 (70.5) was slightly below the rate for 1980 (71.3), all age-specific rates, except for women 20-24 years of age, have increased since 1980. The largest percentage increases in age-specific fertility rates were for women age 35 years and older. The rate for women 35-39 years of age increased from 22.2 per 1,000 women in 1980 to 36.7 in 1994, or 65.3 percent. The fertility rate for women 40-44 years of age increased 53.5 percent (from 4.3 to 6.6) over the same period.

For women age 35-39 years, the proportion of births that are first children was also higher than in 1980. In 1980, 9.3 percent of all births to women in the age group 35-39 year were first children. By 1994, 14.5 percent of all births to women age 35-39 years were first children. For mothers under 25 years of age, the percentage of all births that were first children decreased from 49.1 percent in 1980 to 46.8 percent in 1994. This means that a greater proportion of births in 1994 to mothers less than 25 years of age represents their second, third, or higher order child, compared to mothers of the same age in 1980.

The mother's level of educational attainment, an item tabulated directly from the birth certificates, is generally inversely related to the fertility rate. However, 45.1 percent of the live births in Illinois during 1994 occurred to women with at least some college education (Text Table 2), slightly higher than the comparable proportion for 1993 (44.0%). In 1994, 77.4 percent of the live births occurred to women with at least a high school education. The educational attainment of mothers varies with race. For example, the proportion of white mothers with at least a high school education in 1994 was 80.0 percent, compared to 66.3 percent for black mothers.

The number of infants born in multiple deliveries (e.g., twins, triplets) in 1994 was 5,403, which was only two more than in 1993. Multiple deliveries accounted for almost 2.9 percent of the total live births, higher than the comparable proportion in 1993 (2.8%). The proportion of multiple births has grown fairly steadily, having risen from 2 percent in 1980.

BIRTHS TO UNMARRIED WOMEN

During 1994, for the first time since 1981, the number of births to unmarried women residents in Illinois decreased (Table D). Births to unmarried women totaled 64,887 in 1994, a decrease of 0.3 percent over the number recorded in 1993 (65,086), but 52 percent above the corresponding number in 1980 (42,749). As also occurred in 1981, however, the percentage of all births that were to unmarried women increased. Births to unmarried women represented 34.3 percent of all Illinois resident live births in 1994, up from 34.1 percent the previous year (Figure 4).

For most age groups, the proportion of all births that were to unmarried women changed from 1990. In 1994, 83 percent of all mothers 15-19 years of age were unmarried, an increase of 3 percentage points from the corresponding proportion in 1990, but much higher than the 57 percent in 1980 (Text Table 3). Since 1990, the proportion of nonmarital births increased among all age groups except for women 40 years of age and over. The proportion of nonmarital births was the smallest for mothers 30-34 and 35-39 years of age (both 14%).

The number of births to unmarried women was disproportionately larger among blacks compared to whites. While black births comprised only 21.6 percent of all Illinois births, the number of births to unmarried black women (32,340) accounted for almost 50 percent of the total nonmarital births in 1994 (Table C). Slightly more than 79 percent of the births to black women were nonmarital births, compared to 22.5 percent among white women (Figure 4). The difference in the proportion of nonmarital births between these two groups varied with age of mother, but remained substantial among the age groups: at least 25 percentage points for all five-year age groups 15 years and older.

For mothers age 25-29 years, the percentage of nonmarital births was 13.7 percent for white mothers and 68.1 percent for black mothers, a difference of 54.4 percentage points and the largest among the five-year age groups.

FIGURE 4. -- RESIDENT BIRTHS TO UNMARRIED WOMEN BY RACE: ILLINOIS, 1950-1994

Nonmarital births also varied with residence. The number of nonmarital births in the city of Chicago (32,122), for example, accounted for nearly 50 percent of the total nonmarital births in Illinois in 1994, despite the fact that only 24 percent of the state's population resided in Chicago. More than half (56.0%) of the total births in Chicago were nonmarital births compared to 24.8 percent Downstate.

TEXT TABLE 3. -- PROPORTION OF NONMARITAL BIRTHS BY AGE OF MOTHER:
ILLINOIS, 1980, 1990 AND 1994

Age of mother (years)	Proportion of Nonmarital births		
	1980	1990	1994
15-1957	.80	.83
20-2425	.45	.52
25-2911	.19	.22
30-3408	.13	.14
35-3909	.13	.14
40 and over15	.16	.16

PRENATAL CARE

The proportion of mothers who began prenatal care during the first trimester of pregnancy was 80.3 percent in 1994, slightly higher than the 1993 value of 79.2 percent. On the other hand, the proportion of mothers initiating care in the third trimester or receiving no care at all was 4.4 percent in 1994, below the 1993 value of 4.6 and the fourth consecutive year of decline since 1990 (5.4%).

There was a difference by race in the timely receipt of prenatal care. In 1994, the proportions of white mothers and nonwhite mothers who began care in the first trimester were 84.2 percent and 68.0 percent, respectively. Also, 3.1 percent of white mothers and 8.5 percent of nonwhite mothers received third trimester care or no care.

Initiation of early prenatal care also varied with age of mother (Text Table 4). In 1994, only 42.2 percent of mothers under 15 years of age and 61.6 percent of those age 15-19 years began care in the first trimester compared with 89.0 percent of those 30-34 years of age and 88.4 percent of those 35-39 years of age. The age disparity in early receipt of prenatal care has widened over the last several years. After declining from 1980 (56.2%), the proportion of mothers age 15-19 years receiving early prenatal care rose between 1990 (55.6%) and 1994 (61.6%). While still below the 1980 level (74.0%), the proportion of mothers 20-24 years of age receiving first trimester care for 1994 (73.0%) increased from 1993 (71.3%) and 1992 (69.8%) proportions. With the exception of those mothers 20-24 years of age, all other age groups showed higher percentages of receipt of early prenatal care in 1994 than in 1980.

Timely receipt of prenatal care also varied by marital status of the mother. Married mothers of all races were more likely to initiate care during the first trimester than were unmarried mothers for each age group (Text Table 4). In 1994, 88.6 percent of all married mothers initiated prenatal care during the first trimester of pregnancy compared to 64.1 percent of unmarried mothers.

TEXT TABLE 4. -- PRENATAL CARE INITIATED IN THE FIRST TRIMESTER OF PREGNANCY, AS PERCENT OF RESIDENT LIVE BIRTHS BY RACE, AGE AND MARITAL STATUS OF MOTHER: ILLINOIS, 1994

Age of mother (years)	Percent initiated in first trimester ⁽¹⁾

* Ratio does not meet standards of reliability or precision; numerator less than 10 or denominator less than 100.

INFANT HEALTH

The proportion of infants who were born in hospitals was about the same in 1994 as in the previous 10 years, 99.3 percent. At birth, babies weighing less than 2,500 grams (low birthweight) totaled 14,957 in 1994, or 7.9 percent of all live births, down from the 8.1 percent reported in 1993.

The incidence of low birthweight varied with race. Among black infants, the incidence of low birthweight was 14.8 percent in 1994, down from 15.3 percent in 1993; for white infants, it was 5.9 percent in 1994, the same proportion as in 1993.

The risk of low birthweight varied with the mother's age (Text Table 5 and Figure 5). The risk was highest (10.7%) for infants born to mothers under 18 years of age, decreasing to the lowest level (7.1%) for infants born to mothers 25-29 years of age, and then rising to 10.0% for those born to mothers 40 years of age and over. This age-specific U-shaped curve pertaining to the probability of low birthweight was evident among infants born to white women, but less so among infants born to black women where, except for the mothers under 18 years of age, the percentage of low birthweight increased with age of mother.

The risk of low birthweight also varied with marital status (Text Table 5 and Figure 5). The 1994 incidence of low birthweight was nearly twice as high for infants born to unmarried mothers (11.7%) as for infants born to married mothers (5.9%). The difference was more than double for mothers 25 to 39 years of age.

Likewise, when black mothers and white mothers were examined separately, the differences in the incidence of low birthweight between infants born to unmarried mothers and those born to married mothers were still evident. For both whites and blacks the difference in the risk of low birthweight was higher for infants born to unmarried mothers than those born to married mothers, especially for mothers in age groups 25 years and over.

FIGURE 5. -- PERCENT OF RESIDENT LIVE BIRTHS WITH LOW BIRTHWEIGHT BY AGE AND MARITAL STATUS OF MOTHER: ILLINOIS, 1994

Infants born to mothers from Chicago tended to have a higher prevalence of low birthweight than did infants born to Downstate mothers. There were 10.9 percent of all infants born to Chicago mothers in 1994 who were of low birthweight, compared with 6.6 percent among Downstate infants (Table B). There were slight differences by race between Chicago and Downstate. Infants born to Chicago black mothers had low birthweights 16.1 percent of the time versus 12.5 percent

⁽¹⁾Includes races other than white and black

to Downstate black mothers. For whites, it was 6.4 percent for Chicago and 5.8 percent for Downstate.

Another indicator of the health condition of infants is the Apgar score. The Apgar score is a composite evaluation that, on a scale from 0 to 10, measures the newborn's physical condition based on heart rate, respiratory effort, muscle tone, reflex response and color at one minute and five minutes after birth. A score of 10 is optimum. In 1994, high Apgar scores of 9 or 10 were reported for 49.5 percent of all babies, for whom Apgar scores were reported, at one minute after birth and 91.5 percent at five minutes after birth. Low scores of 0 to 6 (indicating severe to moderate asphyxia) were assigned to 7.7 percent of babies at one minute and to 1.4 percent at five minutes in 1994.

Apgar scores varied by race. In 1994, higher proportions of black infants than white infants had low five-minute Apgar scores. For Illinois residents during 1994, 2.7 percent of black babies had a five-minute Apgar score of less than 7 compared with 1.0 percent of white infants.

BIRTHS TO HISPANIC WOMEN

The number of births to Hispanic mothers totaled 30,346 in 1994, an increase of 6.1 percent over the number in 1993 (28,593). On the other hand, the number of births to non-Hispanic mothers decreased by 2 percent, from 162,116 in 1993 to 158,836 in 1994. As a result, the proportion of total live births in Illinois to Hispanic mothers increased from 15.0 percent in 1993 to 16.0 percent in 1994.

Of all Hispanic births in 1994, 79.3 percent were to mothers of Mexican origin, an increase from 76.9 percent in 1993. The proportion and number of Hispanic births to Puerto Rican mothers declined from 11.3 percent (3,225 births) in 1993 to 10.1 percent (3,068 births) in 1994. During 1994, as in previous years, virtually all Hispanic births, regardless of whether they were to Mexican or Puerto Rican mothers, were reported as white births (Text Table 6).

TEXT TABLE 6. -- NUMBER AND PERCENT DISTRIBUTION OF LIVE BIRTHS BY RACE OF MOTHER, ACCORDING TO HISPANIC ORIGIN OF MOTHER: ILLINOIS, 1994

All origins		Hispanic				Non-Hispanic
		Total	Mexican	Puerto Rican	Other and unknown	
Number of births						
All races	189,182	30,346	24,073	3,068	3,205	158,836
White	142,170	30,190	24,030	3,025	3,135	111,980

White	75.1	99.5	99.8	98.6	97.8	70.5
Black	21.6	0.5	0.2	1.4	2.0	25.6
Other	3.2	0.0	0.0	0.0	0.2	3.9

Hispanic mothers continue to be highly concentrated within a few counties. In 1994, 87.5 percent of all Hispanic births occurred to residents of three counties (Cook, Kane and Lake). Cook County alone accounted for 75.6 percent of all Hispanic births in the state, including 89.1 percent of all Puerto Rican births (Text Table 7).

Hispanic women differed from non-Hispanic women not only in reproductivity, but also in the likelihood of being a teenage mother (Text Table 8). The proportion of teenage mothers among Hispanic mothers (16.8%) was greater than that among white non-Hispanic mothers (7.9%), but smaller than that among black non-Hispanic mothers (26.0%). The corresponding proportion among Puerto Rican mothers (22.5%) was higher than that among Mexican mothers (16.5%), and "other and unknown" Hispanic mothers (13.1%).

Text Table 8 also indicates that Hispanic mothers had a higher proportion of births among the peak childbearing years compared to births among non-Hispanic mothers. Hispanic mothers 20 to 29 years of age accounted for almost 60 percent of all Hispanic births, while births to non-Hispanic white mothers in this age group accounted for just under 49 percent and births to non-Hispanic black mothers in the same age group accounted for almost 53 percent of all births. On the other hand, among the stated racial and ethnic groupings (excluding "other non-Hispanic" and "other and unknown Hispanic") in Text Table 8, non-Hispanic white mothers had the largest proportion of births to mothers 30 years of age and over (43.3%), followed by Mexican mothers at 23.1 percent. The proportion of births to mothers 30 years of age and over was smallest among Puerto Rican mothers (19.9%)

Hispanic mothers also differed from non-Hispanic mothers with respect to marital status (Text Table 9). The percentage of childbearing by unmarried mothers increased for both Hispanic and non-Hispanic women between 1993 and 1994. There is a difference, however, between the Hispanic and non-Hispanic populations in the proportions of unmarried mothers. In 1994, 38.3 percent (11,629) of Hispanic births were to unmarried mothers compared with 33.5 percent (53,258) of non-Hispanic births. However, the proportion of infants born to unmarried women was higher among Hispanic women, especially Puerto Rican women, than that among non-Hispanic white women. The proportion of infants born to unmarried non-Hispanic black women was the highest of any race or ethnicity at 79.1 percent.

In 1994, Hispanic women, both Mexican and Puerto Rican, tended toward a larger number of births throughout their lifetimes than non-Hispanic white women. For example, 19.9 percent of Hispanic births were to women who already had at least three natural children, compared with 17.2 percent of non-Hispanic white births (Text Table 9).

As in 1993, Hispanic mothers giving birth in 1994 were much less likely than non-Hispanic mothers to have completed high school. In 1994, 43.4 percent of all Hispanic women giving birth were high school graduates, compared with 89.7 percent of non-Hispanic white and 66.3 percent of non-Hispanic black mothers (Text Table 9). Mexican mothers were the least likely to have completed high school. Only 38.9 percent of Mexican mothers had completed 12 or more years of school and 35.2 percent had limited schooling (eight years or less).

Hispanic mothers were also less likely to receive prenatal care beginning in the first trimester of pregnancy and were more likely to receive delayed care or none at all than non-Hispanic white mothers. In 1994, the proportion of Hispanic mothers who received prenatal care beginning in the first trimester was 69.6 percent, approximately the same as the level for non-Hispanic black mothers (66.0%), but below the level for non-Hispanic white mothers (88.1%). The proportion of Mexican mothers in 1994 who received care beginning in the third trimester or no care at all was 7.0 percent, a decrease from 7.8 percent in 1993.

Infants born to Hispanic mothers in 1994 had lower percentages of low birthweight and of one- and five-minute Apgar scores of less than 7 compared to infants born to non-Hispanic mothers. Among babies born to Hispanic mothers, only those born to Puerto Ricans had an incidence of low birthweight (8.9%) greater than that for those born to non-Hispanic mothers (8.3%). The incidence of low birthweight was highest among infants born to non-Hispanic black mothers (14.8%). Low birthweight incidence among infants born to Mexican and other and unknown Hispanic mothers (5.4% and 6.8%, respectively) was similar to that for non-Hispanic white babies (5.9%). One-minute Apgar scores of less than 7 occurred less frequently among infants born to Hispanic mothers (5.9%) than among infants born to non-Hispanic white mothers (7.2%). However, the proportions of babies with five-minute Apgar scores of less than 7 (indicating severe to moderate asphyxia) were nearly the same for those born to mothers among the various Hispanic groups (1.1% to 1.2%) and those born to non-Hispanic white mothers (1.0%). The proportion of babies with one- and five-minute Apgar scores of less than 7 were highest for non-Hispanic black mothers (10.3% and 2.7%, respectively).

MORTALITY

GENERAL MORTALITY

In 1994, there were 106,911 Illinois resident deaths of which 4,366 occurred outside of Illinois. There were 102,545 deaths recorded in Illinois of which 1,872 occurred to persons who were not residents of the state. The total number of resident deaths in 1994 was slightly more than the number in 1993 (106,875) and was the largest number of resident deaths recorded since 1974 (Table A). The 1994 crude death rate (number of deaths per 1,000 population) was 9.1, the same as for 1993 and higher than the 8.8 recorded in 1992 and the 9.0 recorded for the three years prior to 1992. The crude death rate has declined slowly and steadily since 1920. However, since 1975, the crude death rate has fluctuated between 8.8 and 9.2 (Figure 3). Nevertheless, one should not conclude that Illinois residents had roughly the same probability of dying in 1994 as, for example, in 1980. Quite to the contrary, the age-specific death rates for each age group, except for persons 15-24 and 25-44 years of age, were lower in 1994 than the rates in 1980 (Text Table 10).

Despite the declines in many of the age-specific death rates from 1980 to 1994, the crude (all ages) death rate has increased. The reason is that, although the force of mortality has decreased, this has been offset by the general aging of the population. In other words, larger proportions of the population are in the older age groups, which have higher death rates, and this is the main reason for the lack of decline in the total number of deaths during the 1980s and 1990s. According to the 1980 decennial census, the median age for Illinois in 1980 was 29.9 years, lower than the 33.8 years estimated for 1994. The total number of deaths in 1994 would have been lower had the age structure been the same as in 1980.

TEXT TABLE 10. -- AGE-SPECIFIC DEATH RATES: ILLINOIS, 1980, 1990 AND 1994
(Rates per 100,000 population in specified age group)

Age (years)	1980	1990	1994
All ages	895	898	910
Under 1	1,515	1,140	909
1-4	64	46	49
5-14	31	21	24
15-24	109	98	112
25-44	171	175	189
45-64	960	837	764
65 and over	5,471	5,175	5,267

Since 1990, the age-specific death rate for children under 1 year of age declined from 1,140 deaths per 100,000 population in the age group to 909 in 1994, a change of -20.3 percent. Only one other age group (those 45-64 years of age) had a decline in the age-specific death rate in 1994 when compared to 1990, down -9 percent. All other age groups had higher age-specific death rates in 1994 when compared to 1990. The largest percent increases since 1990 were for those 5-14 and 15-24 years of age, both with a 14 percent increase. For the 5-14 year age group, the percentage change resulted from an increase of only three deaths per 100,000 in the age group over the 1990 rate (24 compared to 21). Other increases occurred in age-specific death rates for those 1-4 years of age (7%), 25-44 years of age (8%) and 65 years of age and over (2%).

Age-specific death rates by sex and race for Illinois show that for each sex/age group, nonwhites had higher death rates than whites (Text Table 11). Nevertheless, the crude (all ages) death rate for nonwhites was lower than that for whites, especially for females. Again, the differences between the age-specific rates for nonwhites and whites compared to the differences between the crude rates are due to differences in age structure, with the nonwhite population having higher proportions among the younger age groups (a median age of 28.8 years in 1994) than the white population (34.9 years).

Differences are also apparent in the age-specific death rates between males and females. Among both nonwhites and whites, males exhibited higher death rates than females for every age group. The differences were particularly pronounced for the age groups 15-24, 25-44, and 45-64 years.

**TEXT TABLE 11. -- AGE-SPECIFIC DEATH RATES BY SEX AND RACE:
ILLINOIS, 1994**

PERINATAL AND INFANT MORTALITY

Since many of the same causes underlie fetal deaths and deaths that occur among live-born infants soon after delivery, these losses are often combined and collectively termed "perinatal" deaths. Those

for which fetal death certificates were filed (usually 20 weeks gestation and later) plus deaths of live-born infants younger than 7 days of age are used in this report to compute perinatal mortality. By this definition, there were 2,369 perinatal deaths among the Illinois population in 1994, comprising 1,487 fetal deaths (compared to 1,458 in 1993) and 882 infant deaths under 7 days of age (compared to 977 in 1993), in total 66 fewer perinatal deaths than in 1993. The 1994 perinatal mortality ratio was 12.4 deaths per 1,000 fetal deaths and live births, below the 12.7 ratio for 1993. Of total perinatal deaths, blacks accounted for a disproportionate share: about 39 percent (917), compared to the proportion of black births among all births (22%). As in previous years, the 1994 perinatal mortality ratio was more than twice as high for the black population (22.1) as it was for the white population (9.8). Among Hispanics, the perinatal mortality ratio was 10.4. For all races, the city of Chicago had a higher perinatal mortality ratio (16.2) than Downstate (10.8; Table F).

In 1994 in Illinois, there were 1,711 infants who did not survive to their first birthday, or a rate of 9.0 infant deaths per 1,000 live births. In 1993, there were 1,838 infant deaths and a rate of 9.6, and in

1990 there were 2,090 infant deaths and a rate of 10.7 (Text Table 12). In 1994, the Chicago infant mortality rate was 12.5 and for Downstate was 7.6. However, from 1990-1994 the Chicago infant mortality rate decreased about 20 percent, while the Downstate rate decreased a little more than 10 percent. Over this same period, the Illinois infant mortality rate decreased about 16 percent.

Among Hispanics, the 1994 infant mortality rate was 7.0 deaths per 1,000 births, similar to the white rate (which includes white Hispanics) of 6.7. The black infant mortality rate was 17.9. There has been a persistent difference in infant mortality between blacks and whites (Figure 6). In Illinois from 1960-1994, the nonwhite/black infant mortality rate was about one and three-quarters to almost three times as high as the white rate. Over this same 35-year period, the rate ratio of nonwhite/black to white infant mortality increased, meaning the nonwhite/black rate has improved more slowly than the white rate. During the 1960s, the rate ratio of nonwhite to white infant mortality ranged from 1.73 to 2.09 (meaning the nonwhite rate was about one and three-quarters to over twice as high as the white rate) and, during the 1970s, from 1.78 to 2.17. From 1960 to 1979, the nonwhite infant mortality rate improved 36.6 percent, while the white infant mortality rate improved 45.9 percent. During the 1980s, the black to white infant mortality rate ratio ranged from 2.18 to 2.48 and, during 1990 to 1994, from 2.64 to 2.91. From 1980 to 1994, the black infant mortality rate improved 31.4 percent and the white rate improved 42.2 percent.

Especially when making year-to-year comparisons, rates should be thought of as estimations as the number of events becomes small and thus more subject to chance fluctuation. To avoid making false inferences in comparing rates over time, Figure 7 shows 95 percent confidence intervals for Illinois infant mortality rates from 1980-1994. The confidence interval means there is a 95 percent chance that the "true" infant mortality rate is within a specified range (which is normally distributed,

FIGURE 6. -- INFANT MORTALITY RATE BY RACE: ILLINOIS, 1960-1994

meaning there is a central tendency within the range). In comparing one year's rate with another year's, a large overlap of ranges indicates there is no statistically significant difference between the two rates. In Figure 7, for example, the only two-year periods where the infant mortality rates were statistically significantly different ($p < .05$) were 1980-81, 1982-83, 1989-90, and 1991-92. (The Illinois infant mortality rates for 1922 through 1994 are shown in Table A.)

Infant deaths often are divided into two periods: neonatal (0-27 days) and postneonatal (28-364 days). One reason for doing so is that somewhat different health risks are present during each period, which in turn have different effects on morbidity and mortality. It can be seen in Figure 8 that from 1960 to 1994 neonatal mortality improved, about 68 percent (from 18.1 deaths per 1,000 births to 5.8) over the 35-year period, while postneonatal mortality improved somewhat less, at 52 percent (from 6.9 deaths per 1,000 births to 3.3). As in previous years, the 1994 neonatal death rate among black infants was more than twice as high as that among white infants: 10.9 per 1,000 live blacks compared

FIGURE 7. -- INFANT MORTALITY RATE WITH 95 PERCENT CONFIDENCE INTERVAL: ILLINOIS, 1980-1994

with 4.5 for whites. The neonatal mortality rate for Hispanics was 4.3. Similarly, the 1994 postneonatal mortality rate among black infants was 7.0 deaths per 1,000 births compared to 2.2 among white infants. The Hispanic postneonatal mortality rate was 2.6.

Figure 9 shows the leading causes of death for the neonatal period and Figure 10 the leading causes for the postneonatal period for 1970, 1980, 1990 and 1994. (See Table G for the leading causes of infant deaths by age for Illinois in 1994.) In 1994, there were 1,091 neonatal deaths. The leading

cause of neonatal deaths in 1980, respiratory conditions of newborn, declined 75 percent from 1980 to 1994. In 1980, this cause represented 36 percent of all neonatal deaths (or 679 deaths) and in 1994 was 15 percent of all neonatal deaths (or 167 deaths). The leading cause of neonatal deaths in 1994 was disorders relating to short gestation and unspecified low birthweight (269 deaths), followed by congenital anomalies (254 deaths). These causes represented 25 percent and 23 percent, respectively, of all neonatal deaths.

FIGURE 8. -- NEONATAL, POSTNEONATAL AND INFANT MORTALITY RATES
ILLINOIS, 1960-1994

In 1994, there were 620 postneonatal deaths. Among these deaths, the leading cause in 1980 and 1994 was sudden infant death syndrome (SIDS). (*Nota Bene:* In Figure 10, there is no 1970 [ICD-8] acceptable SIDS-equivalent classification category.) The proportion of SIDS among all postneonatal deaths has remained approximately the same: 39 percent (349 deaths) in 1980 and 38 percent in 1990 and 1994 (272 and 233 deaths, respectively). The second leading cause among all postneonatal deaths in 1980 and 1994 was congenital anomalies. In 1980, there were 169 postneonatal deaths due to congenital anomalies (or 19% of all postneonatal deaths), 123 deaths in 1990 (17%), and 90 deaths in 1994 (15%).

LEADING CAUSES OF DEATH

Maternal deaths (24) and infant deaths (1,711) accounted for 1.6 percent of the state's total deaths. In 1994, there were 106,911 deaths among Illinois residents and, as in 1993, the 12 leading causes of death accounted for approximately 84 percent of these deaths. Approximately two out of three deaths (63.3%) were caused by the first three leading causes of death: heart disease (32.9%), malignant neoplasms (cancer, 23.5%) and cerebrovascular disease (stroke, 7.0%). Appendix 3 provides the classification of cause-of-death data presented in this publication.

Among the 12 leading causes of death (Tables O and P), the top four causes remained unchanged in ranking from 1993 to 1994. Chronic obstructive pulmonary diseases and allied conditions (COPD) remained as the fourth largest cause of death contributing 4.0 percent of all deaths. Following COPD as the fifth and sixth leading causes of death were unintentional injuries (3.8% of all deaths) and pneumonia and influenza (3.7%), which traded positions since 1993. Diabetes mellitus (2.4%) ranked as the seventh leading cause in 1994, the same position as in 1993. HIV infections (1.4%) moved from ninth to eight while homicide (also 1.4%) rose from 10th to ninth position. Nephritis, nephrotic syndrome and nephrosis (1.4%), 8th in 1993, fell to 10th for 1994. In 11th position in 1994 was septicemia (1.1%), not listed among the 12 leading causes of death in 1993. Chronic liver disease and cirrhosis (1.1%) was 12th in 1994.

Death rates were higher in 1994 than in 1993 for seven of the 12 leading causes. Five causes--heart disease, malignant neoplasms, chronic obstructive pulmonary diseases and allied conditions, pneumonia and influenza, and nephritis, nephrotic syndrome and nephrosis--exhibited lower death rates in 1994 when compared to 1993. The largest increase was for unintentional injuries, which rose from 31.8 to 34.2 deaths per 100,000 population, or 7.5 percent. The next largest increase was for septicemia, which rose from 9.7 to 10.4, or 7.2 percent. Chronic liver disease and cirrhosis, increased by 6.1 percent after declining (-9.1%) from 1992 to 1993. The rates for both homicide (which declined from 1992 to 1993) and HIV infections increased by 2.4 percent over their 1993 values. Lesser increases were seen during 1994 in diabetes mellitus (1.9%) and cerebrovascular disease (1.6%).

Rates and ranks for the 12 leading causes of death varied by age (Tables P and Q). Among the 12 listed causes, unintentional injuries was the leading cause of death for persons under 45 years of age. For persons 5-14 years of age, homicide (3.1 deaths per 100,000 population in the age group) was the second most common cause of death while malignant neoplasms (2.1) was the third leading cause of death. Homicide (37.8) was the second leading cause of death for persons 15-24 years of age, following unintentional injuries (38.9). For those 25-44 years of age, HIV infections (29.1) ranked as the second leading cause of death. The leading cause of death among persons 45-64 years of age was malignant neoplasms (275.1), followed by heart disease (220.4). For persons 65 years of age and over, the leading cause of death was heart disease, followed by malignant neoplasms.

The leading causes of death among whites and nonwhites were not the same for all age groups. For example, homicide was the most frequent cause of death among nonwhites 15-24 years of age and was the third most frequent cause of death among nonwhites overall in 1994 (Table H). Age-specific death rates for homicide among nonwhites were higher than those for whites in every age group except age 85 years and over where the incidence was not sufficient to calculate a rate (Table P). Deaths from heart disease and malignant neoplasms were commonly the leading two causes of death among the

older age groups for both whites and nonwhites. Deaths from heart disease and malignant neoplasms among persons 65 years of age and older accounted for 57.9 percent of all deaths among whites and 48.5 percent of all nonwhite deaths.

Chicago had higher death rates than Downstate for nine of the 12 leading causes. Downstate rates were higher for malignant neoplasms, cerebrovascular disease, and chronic obstructive pulmonary diseases and allied conditions (Table P). Ten leading causes of death by race are given in Table H. The 12 leading causes of death for residents of Illinois, Chicago and Downstate are given in Table O with corresponding rates in Table P. Table Q shows leading causes of death by selected age groups.

OTHER CAUSES OF DEATH

The next most frequent causes of death in 1994 were suicide (1,055), Alzheimer's disease (947), certain conditions originating in the perinatal period (836), aortic aneurism (763), atherosclerosis (624), and congenital anomalies (519).

DEATHS FROM DRUGS

Deaths from drugs, excluding those from therapeutic misadventure, accounted for 658 deaths in 1994 including four deaths to persons less than 15 years of age. This is 48 fewer deaths than in 1993 (Text Table 13), a 6.8 percent decrease. The largest numerical decrease in 1994 was in age group 35-44 years of age, down 67 from the 1993 number. Age groups 15-24, 35-44, and 45-54 years of age also showed lower numbers of deaths from drugs in 1994 when compared to 1993. Numbers were higher for those 25-34 years of age and 55 years of age and over.

In 1994, there were 149 more deaths from drugs than in 1990, and 355 more than occurred in 1980. Age groups from 25 to 54 years of age showed higher numbers of deaths from drugs than in both 1990 and 1980. All age groups except for persons 55 years of age and over had higher numbers of deaths in 1994 than in 1990.

Among all deaths from drugs, nine were classified as being due to drug dependence, 11 to nondependent abuse of drugs, 514 to accidents, and 105 to suicides. There were two homicides and 17 other deaths due to drugs where the cause could not be determined. All the above categories of deaths due to drugs decreased in number from 1993 to 1994, except for suicides and nondependent use of drugs, which remained at their 1993 levels of 105 deaths and 11 deaths, respectively. Within the larger category of accidental deaths due to drugs, however, deaths due to local anesthetics, including cocaine, increased by 12 over the 1993 value.

**TEXT TABLE 13. -- RESIDENT DEATHS AND DEATH RATES BY AGE FOR DEATHS
FROM DRUGS⁽¹⁾: ILLINOIS, 1980, 1990, 1993 AND 1994**
(Rates per 100,000 population in specified age group)

Age (years)	Deaths due to drugs							
	Number				Rate			
	1994	1993	1990	1990	1994	1993	1990	1980
All ages	658	706	509	303	5.6	6.0	4.4	2.6
15-24	51	54	27	70	3.2	3.3	1.6	3.3

YEARS OF POTENTIAL LIFE LOST (YPLL)

In 1994, among Illinois residents, there were an estimated 580,296 "years of potential life lost" (YPLL). YPLL is calculated by subtracting each decedent's age in years from 65 among those who died before reaching age 65 years and summing those numbers into a total. Age 65 is used as an arbitrary standard for the upper limit of "potential life." The average YPLL per death is calculated by dividing YPLL by the number of persons who died before reaching age 65. The 1994 Illinois average YPLL per death was 20.1 years (Text Table 14), lower than 1992 and 1993 (both 20.2 years) and 1991 (20.4 years). Comparable values for 1989 and 1990 were 20.1 and 20.0 years, respectively. (The higher the average YPLL per death, the younger the age below 65 years persons are dying, on average.)

Illinois' seven largest contributing causes of death to YPLL were unintentional injuries (93,987), malignant neoplasms (81,163), heart disease (67,562), certain conditions originating in the perinatal period (54,045), homicide (53,628), HIV infection (37,946), and congenital anomalies (27,611). A comparison of the seven largest contributing causes of death to YPLL for Chicago and Downstate shows some differences (Figures 11 and 12). In Chicago, homicide was the largest contributing cause of death to YPLL and comprised 15.4 percent of all Chicago YPLL. For Downstate, homicide was the sixth largest contributing cause and accounted for 5.3 percent of all Downstate YPLL. The fourth largest contributing cause of death to YPLL for Chicago was HIV infection, which did not appear among the seven largest causes for Downstate. Similarly, the seventh largest contributing cause for Downstate was suicide, which did not appear among the seven largest causes for Chicago.

TEXT TABLE 14. -- THE SEVEN LEADING CAUSES OF DEATH CONTRIBUTING TO YEARS OF POTENTIAL LIFE LOST (YPLL) FOR ILLINOIS RESIDENTS: 1994

Rank	Cause of death	YPLL	Percent of total	Deaths age 0-64	Average number of YPLL per death age 0-64 years
1	Unintentional injuries	93,987	16.2	2,903	32.4
2	Malignant neoplasms	81,163	14.0	7,434	11.3
3	Heart disease	67,562	11.6	6,003	11.3
4	Certain conditions originating in the perinatal period	54,045	9.3	835	64.7
5	Homicide	53,628	9.2	1,432	37.4
6	HIV infection	37,946	6.5	1,454	26.1
7	Congenital anomalies	27,611	4.8	487	56.7
	All other causes	164,354	28.3	8,353	19.7
	TOTAL	580,296	100.0	28,901	20.1

FIGURE 11. -- NUMBER OF YPLL* FOR THE SEVEN LARGEST CONTRIBUTING CAUSES: CHICAGO, 1994

* Years of potential life lost

The "average number of YPLL per death age 0-64 years" column in Text Table 14 illustrates the relative impact different causes of death contribute per death to YPLL. Causes of death where the average age at death is very young, such as certain conditions originating in the perinatal period and congenital anomalies, contribute heavily to YPLL per death (for Illinois, 64.7 and 56.7 years, respectively). The external causes of death of unintentional injuries and homicide, along with the internal cause of HIV infection, more typically occur over a wider range of teen and adult ages, with death rates tapering toward the older adult ages. For Illinois, these causes of death contribute between 26.1 and 37.4 years per death to YPLL, on average. The two leading causes of death in Illinois, heart disease and malignant neoplasms, are third and second, respectively, as contributing causes of death to YPLL. However, each death due to these causes contributes relatively few years (approximately 11 years on average if the death occurred under age 65 years) or no years (if the death occurred at age 65 or over) to YPLL.

VITAL STATISTICS SPECIAL REPORTS

In past years, the Illinois Department of Public Health has issued a number of special reports dealing with a wide array of topics. For a complete listing of those reports, see earlier volumes of *Vital Statistics Illinois*.

VITAL STATISTICS BASIC RESEARCH SERIES

In October, 1996 the Illinois Department of Public Health began quarterly publication of *Vital Statistics Basic Research Series (VSBRS)*. The *VSBRS* contains topics of special interest focusing on vital statistics research and measurement. Also published in each issue of *VSBRS* are the latest selected vital statistics for the state of Illinois, the city of Chicago and Illinois' 102 counties.

Volume 1, No. 1 (October 1996)

"Years of Potential Life Lost (YPLL) by Age and Sex for Illinois, Chicago, and Downstate"
Selected Vital Statistics for 1993 and 1994

Volume 1, No. 2 (January 1997)

"A Public Health Perspective on the Utility of the 'Experimental' Postcensal County Population Estimates by Age, Sex and Race from the U.S. Bureau of the Census"
Selected Vital Statistics for 1994 and 1995

Volume 1, No. 3 (April 1997)

"Heat-Related Mortality in Illinois, Chicago, and Downstate During 1995: Direct and Indirect Impacts"
Selected Vital Statistics for 1994 and 1995

Volume 1, No. 4 (July 1997)

"Post-censal Estimation of Life Expectancy at Birth for Illinois and Selected Substate Areas"
Selected Vital Statistics for 1994 and 1995

To receive a copy of any *Vital Statistics Basic Research Series* or Vital Statistics special report or to be placed on a mailing list to receive future *VSBRS* issues, contact the Illinois Department of Public Health, Illinois Center for Health Statistics, 525 W. Jefferson St., Springfield, IL 62761; or phone 217-785-1064, TTY (for hearing impaired use only) 800-547-0466. To order previously issued publications, please specify the title of the special report or the title, volume and number of the *VSBRS*.

PERSONS OF HISPANIC ORIGIN MAY BE OF ANY RACE.
MORTALITY RATES ARE PER 100,000 POPULATION IN SPECIFIED AGE GROUP.
YPLL - YEARS OF POTENTIAL LIFE LOST. CALCULATED BASED ON THE NUMBERS OF YEARS BETWEEN AGE AT DEATH AND AGE 65.
* - A RATE OR RATIO DOES NOT MEET STANDARDS OF RELIABILITY OR PRECISION.
-0- - RATE 0 CORRESPONDING TO -- ON FREQUENCIES.
(1) - INCLUDES RACES OTHER THAN WHITE AND BLACK.
(2) - EQUIVALENT TO ACCIDENTS.

PERSONS OF HISPANIC ORIGIN MAY BE OF ANY RACE.
MORTALITY RATES ARE PER 1,000 LIVE BIRTHS, EXCEPT FETAL AND PERINATAL WHICH ARE PER 1,000 LIVE BIRTHS PLUS FETAL DEATHS.
SEPARATE, NOT LINKED BIRTH AND DEATH DATA USED FOR MORTALITY RATES AND NUMBERS.
* - A RATE OR RATIO DOES NOT MEET STANDARDS OF RELIABILITY OR PRECISION.
- RATE O CORRESPONDING TO -- ON FREQUENCIES.
(1) - INCLUDES RACES OTHER THAN WHITE AND BLACK.

PERSONS OF HISPANIC ORIGIN MAY BE OF ANY RACE.
MORTALITY RATES ARE PER 100,000 POPULATION IN SPECIFIED AGE GROUP.
YPLL - YEARS OF POTENTIAL LIFE LOST. CALCULATED BASED ON THE NUMBERS OF YEARS BETWEEN AGE AT DEATH AND AGE 65.
* - A RATE OR RATIO DOES NOT MEET STANDARDS OF RELIABILITY OR PRECISION.
-- - RATE O CORRESPONDING TO -- ON FREQUENCIES.
(1) - INCLUDES RACES OTHER THAN WHITE AND BLACK.
(2) - EQUIVALENT TO ACCIDENTS.

PERSONS OF HISPANIC ORIGIN MAY BE OF ANY RACE.
MORTALITY RATES ARE PER 1,000 LIVE BIRTHS, EXCEPT FETAL AND PERINATAL WHICH ARE PER 1,000 LIVE BIRTHS PLUS FETAL DEATHS.
SEPARATE, NOT LINKED, BIRTH AND DEATH DATA USED FOR MORTALITY RATES AND NUMBERS.
- A RATE OR RATIO DOES NOT MEET STANDARDS OF RELIABILITY OR PRECISION.
- RATE O CORRESPONDING TO -- ON FREQUENCIES.
- INCLUDES RACES OTHER THAN WHITE AND BLACK.

APPENDIX 1. DATA SOURCES AND ANALYSIS

VITAL RECORDS SYSTEM

State statute requires that all vital record certificates be filed with the Illinois Department of Public Health. The director of the Department is also the state registrar who, in turn, delegates authority to the deputy state registrar to administer and enforce the Vital Records Act. The requirement to register births and deaths was first included in the legislation that established the State Board of Health in 1877. However, the law did not provide workable enforcement, and the system failed for lack of central legal control over the data collection process. After several attempts, a law incorporating the elements of an efficient system became effective January 1, 1916. Slight modifications were made over the years until January 1, 1962, when the current law, including several significant provisions, became effective.

The original live birth, death, and fetal death certificates are collected by local registrars of vital records who are appointed by, and are under direct supervision of, the state registrar. Local registrars keep a copy of each certificate for their files and for the files of the county clerk and send the original to the Illinois Department of Public Health. (See Exhibits 1 through 6 for copies of sample certificates.)

Insuring that a certificate of live birth is filed is the responsibility of the hospital administrator when the birth occurs in a hospital. The attending physician verifies or provides the date of birth and required medical information. When births occur outside hospitals, the physician or other attendant prepares and files the certificate.

Funeral directors must file death certificates with the local registrar in the area in which the death occurred in order to obtain legally necessary burial or removal permits. (A fetal death certificate must be prepared if the fetus is determined to be a product of 20 or more completed weeks of gestation and not born alive.) Medical certification, including a determination of the cause of death, is completed by the physician in charge of the decedent's care unless a coroner's or medical examiner's certificate is filed. A physician may request that a coroner or medical examiner review any death.

The coroner's physician, whose position was established by the Coroner's Act of 1957, is unique in Illinois. When requested, the coroner's physician investigates a death involving a motor vehicle accident, other accidents and forms of violence, suspicious circumstances, or a person found dead. Programs related to boating, recreational gun usage, highway safety, hazardous substance control, drug abuse, law enforcement, suicide prevention, hospital and nursing home construction, home construction, home safety and pesticide control rely heavily on the findings of the coroner, the coroner's physician and, in Cook County, the medical examiner.

The registration system also provides for amendments of birth and death certificates, preparation of new documents for adopted and legitimated children, and the certification of the contents of a record when a citizen needs it.

Central registration of marriages and divorces began on January 1, 1962. Prior to that date, annual counts of marriages and divorces by county were made intermittently. Since 1962, marriage records are filed directly with the Illinois Department of Public Health by county clerks. The application record combines information supplied by applicants for the license and by the marriage officiant. Certificates of divorce or annulment are filed directly with the Department by the clerk of the circuit court. Each certificate contains information supplied by the attorney for the petitioner and from the divorce or annulment decree.

The Division of Vital Records inspects the certificates and requests supplemental information on those that are incomplete, inconsistent or unclear. When a certificate is judged to be acceptable, coded information from the certificate is entered into a database for statistical purposes and this information is shared with the National Center for Health Statistics.

In 1988, the Illinois Department of Public Health initiated testing of an electronic birth certificate (EBC). EBCs were implemented in April, 1991 and by the end of 1994, approximately 90 percent of Illinois hospitals were using this method for the filing of birth certificates.

CUTOFF DATES AND INTERSTATE EXCHANGE

There is no cutoff date for the filing of a vital record as a legal document. However, there must be a cutoff date for inclusion of events for statistical purposes. The cutoff date for 1994 events was April 1995.

Copies of vital record certificates pertaining to persons who were born or died outside of the state of residence are exchanged, usually on a monthly basis, among of the states and the Canadian provinces. The original birth, fetal death or death certificate is never released or received in these transactions. There is no exchange of marriage, divorce or annulment data.

RACIAL CLASSIFICATION

For statistical purposes, vital events in Illinois are classified by race into white, black, American Indian, Chinese, Hawaiian, Japanese, Filipino, other Asian, or Pacific Islander and other. Racial classification for a decedent, bride, groom or for divorcing spouses is based on race stated on the vital record certificate. Prior to 1989, the racial designation used for a live birth or fetal death was determined through an algorithm based on the race of both parents, as reported on the certificate. Since data year 1989, racial classification of live births and fetal deaths has been based solely on the reported race of the mother.

The tables in this report do not show data for a detailed classification by race. In some tables the divisions are white, black and other. In other tables, the classifications are simply white and nonwhite.

HISPANIC ORIGIN

In 1979, an item was added to birth and death certificates to identify ethnic origin of a newborn's parents and of a decedent. An open ended format was used to obtain the specific origin or descent (e.g., Italian, Mexican, English). In 1989, the item was changed to a format directed toward the Hispanic population, requesting only the specific Hispanic origin (e.g., Mexican, Puerto Rican).

COMPUTATION OF PERCENTS

Births with unknown age of mother, month of pregnancy in which prenatal care began, educational attainment of mother, method of delivery, and Apgar scores were subtracted from the figures for total births that were used as denominators before percentages were computed. Percent distributions for marriages and divorces also exclude cases for which the pertinent information (e.g., duration of marriage) is not stated.

INTERPRETATION OF VITAL STATISTICS

Qualifying factors to be considered in the interpretation of vital statistics depend on the specific administrative, scientific or planning purposes for which the data are to be used. It is not feasible to discuss all of the pertinent factors in the use of vital statistics, but the following are some of the more important ones that should be taken into account:

1. Incomplete information. There are failures to provide certain types of information requested on the vital records certificates. Also, the classification systems used to prepare information on the certificates for tabulation do not employ categories that are suitable for every purpose.
2. Erroneous information. Despite procedures used to obtain, process and transmit accurate information, the user of vital statistics should not disregard the possibility of errors.
3. Lack of precise populations exposed to risk requires using estimates that may, in some instances, be inaccurate.
4. Crude rates. Most rates in this report are not adjusted to control for differences in the age, race or sex composition of populations in different geographical areas or

at different periods of time. Divorce rates are not adjusted for peaks in marriage registrations in earlier years.

5. Some tables are designed to focus attention on selected risk groups. Other risk factors could have been selected.
6. Rate stability. Rates based on a small number of events tend to exhibit considerable variation over time because of chance fluctuations. Excessive variation in rates not only negates their utility as estimators of a probability of an event occurring, but also negates their usefulness for comparative purposes.

In Part II of this report, an asterisk is substituted for a printed rate if the rate is based on a numerator less than 10 or a denominator less than 100. These criteria have been adopted to avoid printing rates that are subject to especially large fluctuations.

The numbers "10" and "100" are arbitrary and are not set forth as critical points distinguishing statistically reliable rates from unreliable rates.

To obtain meaningful information for small areas (e.g., counties), rates are presented in Part II that are based on events aggregated over five years. This method of obtaining greater rate stability may obscure major changes that have occurred over time.

VR700 (1988)

ILLINOIS DEPARTMENT OF PUBLIC HEALTH - DIVISION OF VITAL RECORDS

UNED ON 1988 US STANDARD CERT.

APPENDIX 2. DEFINITIONS OF TERMS, RATES AND RATIOS

AGE

Age in years as of last birthday. For infants, age may be stated in days, weeks or months.

BIRTH ORDER

The total number of births the mother has had, including live births and terminations of pregnancy, both spontaneous and induced.

BIRTHWEIGHT

Weight of fetus or infant at time of delivery.

FETAL DEATH

Death prior to the complete expulsion or extraction from its mother of a product of conception, having completed at least 20 weeks of gestation; the fetus shows no signs of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

FIRST PARITY

The first live birth a mother delivers.

INFANT DEATH

Death occurring to an individual less than 1 year of age. The term excludes fetal deaths.

LIVE BIRTH

The complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, which, after such separation, breathes or shows any other evidence of life such as beating of the heart, pulsation of umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

MATERNAL DEATH

Death for which the certifying physician has designated a complication of pregnancy, childbirth or the puerperium as the underlying cause of death.

METROPOLITAN COUNTY

A county with at least one city of 50,000 inhabitants or with "twin cities" with a combined population of at least 50,000; part of a metropolitan statistical area (MSA). Metropolitan county and MSA status are defined and determined by the U. S. Office of Management and Budget.

NEONATAL DEATH

Death occurring to an individual less than 28 days of age.

OCCURRENCE RATE

A rate based on the location of the event. Some rates are calculated according to where the event occurred, regardless of residence, (e.g. marriage and divorce rates).

PERINATAL DEATH

A fetal death or a death occurring to an individual less than 7 days of age.

PREMATURE BIRTH

A live birth or fetal death in which the weight is 2,500 grams (approximately 5 lb. 8 oz.) or less at time of delivery.

RESIDENCE

Usual place of residence. For births and fetal deaths, usual place of residence of mother is used. Some rates are calculated according to place of residence, regardless of where event occurred.

UNDERLYING CAUSE OF DEATH

Disease or condition that gave rise to the chain of morbid events leading to death, or the circumstances of the accident or violence that produced the fatal injury. See Appendix 3 for the causes and ICD numbers used in this report.

Rates and Ratios

Definitions of selected rates and ratios are presented below. No attempt is made to present the method of calculating each vital rate or ratio contained in this report.

The principles applied in computing age-specific, race-specific or other category-specific vital rates may be inferred from the definitions given below for certain category-specific death rates.

$$\text{(Crude) death rate} = 1,000 \text{ or } 100,000 \times \frac{\text{number of deaths}}{\text{population}}$$

$$\text{Cause-specific death rate} = 100,000 \times \frac{\text{number of deaths from the cause}}{\text{population}}$$

$$\text{Race-specific death rate} = 100,000 \times \frac{\text{number of deaths for the race}}{\text{population for that race}}$$

$$\text{Age-specific death rate} = 100,000 \times \frac{\text{number of deaths for the age}}{\text{population for that age}}$$

$$\text{Maternal mortality rate} = 10,000 \text{ or } 100,000 \times \frac{\text{number of maternal deaths}}{\text{number of live births}}$$

$$\text{Perinatal mortality rate} \\ \text{(sometimes designated as a ratio)} = 1,000 \times \frac{\text{number of deaths under 7 days of age} \\ + \text{fetal deaths}}{\text{number of live births} + \text{fetal deaths}}$$

$$\text{Fetal death rate} = 1,000 \times \frac{\text{number of fetal deaths}}{\text{number of live births} + \text{fetal deaths}}$$

$$\text{Fetal death ratio} = 1,000 \times \frac{\text{number of fetal deaths}}{\text{number of live births}}$$

$$\text{Infant mortality rate} = 1,000 \times \frac{\text{number of deaths under 1 year of age}}{\text{number of live births}}$$

$$\text{Neonatal mortality rate} = 1,000 \times \frac{\text{number of deaths under 28 days of age}}{\text{number of live births}}$$

$$\text{Postneonatal mortality rate} = 1,000 \times \frac{\text{number of deaths from ages} \\ \text{28 days through 11 months}}{\text{number of live births}}$$

$$\text{Years of potential life lost (YPLL)} = \Sigma \left(\begin{array}{l} 65 - \text{decedent's age in years for those} \\ \text{who died before reaching their 65th birthday} \end{array} \right)$$

$$\text{(Crude) live birth rate} = 1,000 \times \frac{\text{number of births}}{\text{population}}$$

$$\text{(General) fertility rate} = 1,000 \times \frac{\text{number of live births to women of all ages}}{\text{number of women 15 to 44 years of age}}$$

$$\text{Age-specific birth rate} = 100,000 \times \frac{\text{number of births to women of specified age}}{\text{number of women of that age}}$$

$$\text{Teenage live birth ratio} = 1,000 \times \frac{\begin{array}{l} \text{number of live births to women} \\ \text{under 20 years of age} \end{array}}{\text{number of live births to women of all ages}}$$

$$\text{Ratio of out-of-wedlock childbearing} = 1,000 \times \frac{\text{number of live births to unmarried women}}{\text{number of live births}}$$

$$\text{(Crude) marriage rate} = 1,000 \times \frac{\text{number of marriages}}{\text{population}}$$

$$\text{(Crude) divorce rate} = 1,000 \times \frac{\text{number of divorces and annulments}}{\text{population}}$$

APPENDIX 3. CAUSE-OF-DEATH CLASSIFICATION

Cause-of-death data presented in this publication were classified according to the International Classification of Diseases (ICD) and coded by procedures outlined in World Health Organization regulations.

Revisions in the ICD are made about every 10 years to reflect progress in medical knowledge and changes in the experience of morbid conditions. The eighth revision of the ICD was used in Illinois from 1969 through 1978. Use of the ninth revision began in 1979. The introduction of a new revision often entails major changes in classifications that cause breaks in the continuity of mortality statistics.

When more than one cause of death is cited on the certificate, the cause designated by the certifying physician as "underlying" is, generally, the cause tabulated. When the underlying cause is unclear, the physician is queried for clarification.

ICD ninth revision category numbers for selected causes of death are given below.

CATEGORY NUMBERS FOR SELECTED CAUSES OF DEATH ACCORDING TO NINTH REVISION INTERNATIONAL CLASSIFICATION OF DISEASES ADAPTED FOR USE IN THE UNITED STATES (1975)

I.	Infective and parasitic diseases	001-139
	Intestinal infectious diseases	001-009
	Shigellosis	004
	Gastroenteritis and colitis	009.0-009.1
	Diarrheal diseases	009.2-009.3
	Tuberculosis	010-018
	Late effects of tuberculosis	137
	Zoonotic bacterial diseases	020-027
	Other bacterial diseases	030-041
	Diphtheria	032
	Whooping cough	033
	Streptococcal sore throat and scarlet fever	034
	Meningococcal infection	036
	Tetanus	037
	Septicemia	038
	Gas gangrene	040.0
	Human immunodeficiency virus infection	042-044
	Acute poliomyelitis	045
	Late effects of poliomyelitis	138
	Slow virus infection of central nervous system	046
	Chicken pox	052

	Herpes zoster	053
	Herpes simplex	054
	Measles (rubeola)	055
	Rubella	056
	Viral hepatitis	070
	Rabies	071
	Mumps	072
	Infectious mononucleosis	075
	Typhus	080-081
	Rocky Mountain spotted fever	082.0
	Malaria	084
	Syphilis	090-097
	Gonococcal infections	098
	Other venereal diseases	099
	Mycoses (fungus infections)	110-118
	Sarcoidosis	135
	Pneumocystosis	136.3
II.	Malignant neoplasms	140-208
	Lip, oral cavity and pharynx	140-149
	Digestive organs and peritoneum	150-159
	Respiratory system	160-165
	Trachea, bronchus and lung	162
	Breast	174-175
	Genital organs	179-187
	Urinary organs	188-189
	Other and unspecified sites	170-173, 190-199
	Leukemia	204-208
	Other lymphatic and hematopoietic	200-203
III.	Endocrine, nutritional and metabolic diseases	240-279
	Diabetes mellitus	250
	Cystic fibrosis	277.0
IV.	Diseases of blood and blood forming organs	280-289
	Anemia	280-285
V.	Mental disorders	290-319
	Drug dependence	304
VI.	Diseases of nervous system and sense organs	320-389
	Meningitis	320-322
	Alzheimer's disease	331.0
	Infantile cerebral palsy	343
	Epilepsy	345
	Muscular dystrophy	359

VII.	Diseases of the circulatory system	390-459
	Heart disease	393-398, 402, 404-429
	Chronic rheumatic	393-398
	Hypertensive heart disease	402
	Hypertensive heart and renal disease	404
	Ischemic heart disease	410-414
	Acute myocardial infarction	410
	Other acute and subacute forms	411
	Angina pectoris	413
	Chronic ischemic heart disease	412, 414
	Other diseases of endocardium	424
	All other forms	415-423, 425-429
	Hypertension without mention of heart	401, 403
	Cerebrovascular disease	430-438
	Subarachnoid hemorrhage	430
	Cerebral hemorrhage	431-432
	Cerebral thrombosis	434.0, 434.9
	Cerebral embolism	434.1
	All other	433, 435-438
	Atherosclerosis	440
	Other circulatory diseases	390-392, 441-459
	Aortic aneurysm	441
VIII.	Diseases of the respiratory system	460-519
	Acute upper respiratory infections	460-465
	Acute bronchitis and bronchiolitis	466
	Pneumonia	480-486
	Influenza	487
	Chronic obstructive pulmonary diseases and allied conditions	490-496
	Bronchitis, chronic and unspecified	490-491
	Emphysema	492
	Asthma	493
	Bronchiectasis and extrinsic allergic alveolitis	494-495
	Chronic obstructive lung disease, not elsewhere classified	496
IX.	Diseases of the digestive system	520-579
	Ulcer of stomach and duodenum	531-533
	Hernia and intestinal obstruction	550-553, 560
	Gastritis, duodenitis, enteritis, colitis	535, 555-558
	Cirrhosis of liver	571

X.	Diseases of the genitourinary system	580-629
	Nephritis, nephrotic syndrome and nephrosis	580-589
	Infections of kidney	590
	Hyperplasia of prostate	600
XI.	Complications of pregnancy, childbirth and the puerperium	630-676
XII.	Congenital anomalies	740-759
	Nervous system	740-742
	Heart	745-746
XIII.	Certain conditions originating in the perinatal period	760-779
	Maternal unrelated to pregnancy	760
	Maternal infections	760.2
	Maternal complications of pregnancy	761
	Premature rupture of membranes	761.1
	Multiple pregnancy	761.5
	Maternal death	761.6
	Complications of placenta, cord and membranes	762
	Placenta conditions	762.0-762.3
